TrackCOVID
COVID-19 Exposure Notification System

What is TrackCOVID?

TrackCOVID is a **web app**. That means it's a website that looks and feels like an app. You can view the TrackCOVID app on your phone by visiting **demo.trackcovid.net**.

How do I use TrackCOVID?

To use TrackCOVID, there is only one thing you need to do: scan QR codes, which are called "checkpoints". Checkpoints may be placed at entrances to buildings or sometimes rooms.

Every time you open the web app, your checkpoints will be used to check your risk level. You will see a notification if you're at elevated risk of exposure.

In the unfortunate event that you test positive for COVID-19, you may have the opportunity to protect others by anonymously sharing your checkpoint history. You will be instructed on how to do this.

Is this app tracking me?

The TrackCOVID app **tracks the virus**, not you. In fact, the app does not collect any information about you. Checkpoints that you scan are stored privately on your phone, and the self-reporting process is entirely anonymous and voluntary.
